

Research Project Draft Outline

Topic: The Importance of Online Money Transferring in the Digital Age

Research Idea: Allowing people to enroll in Zelle under the same phone number at different financial institutions

Problem Statement: I work at Nevada State Bank, and a common problem I see with unhappy clients is the fact they cannot enroll in Zelle at our bank because they are already enrolled in Zelle at their other bank. Many people use multiple different banks to keep their assets spread out, and thus many people have many different accounts that they use for a multitude of reasons. Many banks (Bank of America, Chase, Nevada State Bank, etc.) offer Zelle as a service to instantly transfer money to other people. However, once you enroll in Zelle with your phone number at one bank, you are unable to do it ever again. This leaves many people upset that they cannot switch between their bank accounts under one Zelle login.

Data Exploration: I will research things such as two factor authentication, other money transfer sites such as PayPal, Cash App, and Venmo, and I will come up with a plausible comparison of a company that has fixed this problem.

Knowledge Transfer: The insight from this data could cause a change in the way Zelle and online banking in general functions, keeping customer safety a priority and allowing a more positive user experience. Online banking and money transferring is something very common in today's world and it is something that interests me in the broad field of business intelligence.
